Art Unit

2611

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 29 December 2003.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-43 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-11, 13-43 is/are rejected.
- 7) ☐ Claim(s) 12 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 29 December 2003 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

2. Claims 1-3, 6, 7, 10, 11, 14, 22-24, 27, 28 are rejected under 35 U.S.C. 102(e) as being anticipated by Hwang et al. (U.S. Pub. No. 2004/0052236).

Claims 1, 22, Hwang discloses:

- obtaining first data to be delivered to multiple user devices via a common channel ([0150], lines 1-4, 43-48);
- obtaining second data to be delivered to a specific user device via a dedicated channel ([0150], lines 1-4, 43-48);
- acquiring channel information for a common channel between a transmitter and said specific user device ([0153], lines 16-22);
- and generating a transmit signal for said specific user device using said first data, said second data, and said channel information, said transmit signal to be transmitted from said transmitter to said specific user device ([0149], lines 1-6, [0150], lines 43-48, 54-55).

Art Unit: 2611

Claims 2, 23, Hwang further discloses acquiring channel information for a dedicated channel between said transmitter and said specific user device before generating said transmit signal, wherein generating said transmit signal includes using said channel information for said dedicated channel ([0149], [0150]).

Claims 3, 24, Hwang further discloses said transmit signal is configured so that common channel interference will be at least partially cancelled within said specific user device after reception therein ([0153]).

Claim 6, Hwang further discloses acquiring channel information includes receiving channel information from said specific user device ([0153], lines 16-22).

Claim 7, Hwang further discloses said transmitter is part of a base station in a cellular CDMA system (abstract, line 3); and said first data includes data to be broadcast as part of a pilot signal ([0010]).

Claim 10, Hwang further discloses generating a transmit signal includes determining a common channel interference component that would be output by a receiver of said specific user device as a result of transmitting said first data from said transmitter into said common channel without using interference mitigation ([0153], lines 16-22).

Claim 11, Hwang further discloses determining a common channel interference component includes determining an effect of the common channel, as given by said channel information, on said first data ([0153], lines 16-22).

Claim 14, Hwang further discloses transmitting said transmit signal from said transmitter ([0068]).

Claim 27, Hwang discloses:

Art Unit: 2611

- obtaining first data to be delivered to user devices associated with a first class via corresponding dedicated channels ([0150], lines 1-4, 43-48);
- obtaining second data to be delivered to user devices associated with a second class via corresponding dedicated channels([0150], lines 1-4, 43-48);
- acquiring channel information from user devices associated with said second class ([0153], lines 16-22); and
- generating transmit signals to be transmitted to user devices associated with said second class using said first data, said second data, and said channel information ([0149], lines 1-6, [0150], lines 43-48, 54-55).

Claim 28, Hwang does not disclose that the user equipment in his invention includes user devices that do not use dirty paper cancellation techniques.

3. Claims 15, 16, 19, 20, and 41 are rejected under 35 U.S.C. 102(e) as being anticipated by Fitton (U.S. Pub. No. 2004/0028121).

Claims 15, 19, Fitton discloses:

- at least one dipole antenna ([0038], line 5)
- a common channel interference unit to determine a common channel interference component associated with a remote user device ([0081], lines 3-6)
- generating a transmit signal to be transmitted to said remote user device via a dedicated channel, said transmit signal generator using said common channel interference component and dedicated data to generate said transmit signal ([0013], lines 4-5, [0091], lines 1-3)

Art Unit: 2611

- a transmit signal transmitted using said at least one dipole antenna ([0038], line 5)

Claims 16, 20, said common channel interference unit determines said common channel interference component using known common channel transmit data and corresponding channel information ([0087], line 2).

Claim 35, Fitton discloses:

- an interference unit to collect data to be delivered to user devices within a first class via corresponding dedicated channels and to use the collected data to generate a composite interference signal ([0081], lines 3-6);
- a transmit signal generator to generate transmit signals to be transmitted to user devices within a second class via corresponding dedicated channels, said transmit signal generator using said composite interference signal, dedicated data to be delivered to said user devices within said second class, and channel information associated with said user devices within said second class ([0013], lines 4-5, [0091], lines 1-3, [0087], line 2).

Claim 36, Fitton does not disclose that the user equipment in his invention includes user devices that do not use dirty paper cancellation techniques.

Claim 41, Fitton discloses:

- generating a transmit signal for transmission to a remote user device via a dedicated channel that is pre-configured to cancel common channel interference within said remote user device upon reception ([0013], lines 4-5, [0091], lines 1-3, [0087], line 2);

Art Unit: 2611

- and transmitting said transmit signal ([0038], line 5)

Claim Rejections - 35 USC § 103

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claim 8 rejected under 35 U.S.C. 103(a) as being unpatentable over Hwang et al. (U.S. Pub. No. 2004/0052236) as applied to claim 1 above, and further in view of Nishio et al. (U.S. Pub. No. 2006/0166690).

Claim 8, Hwang discloses said transmitter is part of a base station in a cellular CDMA system (abstract, lines 1-3). Hwang fails to disclose data to be broadcast as part of a paging signal, however, Nishio discloses data to be broadcast as part of a paging signal ([0005], lines 6-7). Because Nishio discloses this signaling method has an advantage of more efficient power control ([0008]), it would have been obvious to one skilled in the art at the time of invention to incorporate the paging as disclosed by Nishio into the invention of Hwang.

6. Claims 9 and 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hwang et al. (U.S. Pub. No. 2004/0052236) as applied to claims 1 and 22 above, and further in view of Foschini et al. (U.S. Pub. No. 2003/0104808).

Art Unit: 2611

Claims 9, 25, 29, 30, Hwang fails to disclose using dirty paper cancellation techniques, however, Foschini discloses generating a transmit signal includes using dirty paper cancellation techniques ([0006]). Foschino further discloses the use of these techniques reduces the computational burden of interference cancellation ([0006]). Because of this advantage, it would have been obvious to one skilled in the art at the time of invention to incorporate the dirty paper cancellation as disclosed by Foschini into the invention of Hwang.

7. Claims 13 and 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hwang et al. (U.S. Pub. No. 2004/0052236) as applied to claims 1 and 22 above, and further in view of Shany et al. (U.S. Pub. No. 2004/0030979).

Claims 13, 26, 34, Hwang fails to disclose generating a transmit signal includes performing a modulo lattice operation, however, Shany discloses generating a transmit signal includes performing a modulo lattice operation ([0001]). Because modulo lattice operations have computation advantages in the performing of interference canceling, it would have been obvious to one skilled in the art at the time of invention to incorporate the modulo lattice as disclosed by Shany into the invention as disclosed by Hwang.

8. Claims 17 and 43 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fitton (U.S. Pub. No. 2004/0028121) as applied to claims 15 and 41 above, and further in view of Foschini et al. (U.S. Pub. No. 2003/0104808).

Art Unit: 2611

Claims 17, 37, 38, 43, Fitton fails to disclose using dirty paper cancellation techniques, however, Foschini discloses generating a transmit signal includes using dirty paper cancellation techniques ([0006]). Foschino further discloses the use of these techniques reduces the computational burden of interference cancellation ([0006]).

Because of this advantage, it would have been obvious to one skilled in the art at the time of invention to incorporate the dirty paper cancellation as disclosed by Foschini into the invention of Fitton.

9. Claims 18, 21, and 42 are rejected under 35 U.S.C. 103(a) as being unpatentable over Fitton (U.S. Pub. No. 2004/0028121) as applied to claims 15, 19, and 41 above, and further in view of Shany et al. (U.S. Pub. No. 2004/0030979).

Claims 18, 21, 39, 42, Fitton fails to disclose generating a transmit signal includes performing a modulo lattice operation, however, Shany discloses generating a transmit signal includes performing a modulo lattice operation ([0001]). Because modulo lattice operations have computation advantages in the performing of interference canceling, it would have been obvious to one skilled in the art at the time of invention to incorporate the modulo lattice as disclosed by Shany into the invention as disclosed by Fitton.

10. Claims 4, 5, 31 and 32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hwang et al. (U.S. Pub. No. 2004/0052236) as applied to claims 1 and 27 above, and further in view of Fitton (U.S. Pub. No. 2004/0028121).

Art Unit: 2611

Claims 4, Hwang discloses use within a code division multiple access (CDMA) based system. Hwang fails to disclose said common channel interference will be at least partially cancelled at the chip level, however, Fitton discloses said common channel interference will be at least partially cancelled at the chip level ([0013], lines 4-5, [0091], lines 1-3, [0087], line 2). Because interference cancellation in the transmit signal generation will improve signal efficiency and accuracy, it would have been obvious to one skilled in the art at the time of invention to incorporate the interference cancellation as disclosed by Fitton into the invention of Hwang.

Claim 5, Hwang discloses use within a code division multiple access (CDMA) based system. Hwang fails to disclose said common channel interference will be at least partially cancelled at the symbol level, however, Fitton discloses common channel interference will be at least partially cancelled at the symbol level ([0013], lines 4-5, [0091], lines 1-3, [0087], line 2). Because interference cancellation in the transmit signal generation will improve signal efficiency and accuracy, it would have been obvious to one skilled in the art at the time of invention to incorporate the interference cancellation as disclosed by Fitton into the invention of Hwang.

Claims 31, 32, Hwang fails to disclose generating transmit signals includes generating signals that are configured to cancel interference caused by signals transmitted to user devices, however, Fitton discloses generating transmit signals includes generating signals that are configured to cancel interference caused by signals transmitted to user devices ([0013], lines 4-5, [0091], lines 1-3, [0087], line 2). Because interference cancellation in the transmit signal generation will improve signal efficiency and

Art Unit: 2611

accuracy, it would have been obvious to one skilled in the art at the time of invention to incorporate the interference cancellation as disclosed by Fitton into the invention of Hwang.

11. Claim 33 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hwang et al. (U.S. Pub. No. 2004/0052236) as applied to claim 27 above, and further in view of Ben-David (U.S. Pub. No. 2004/0101034).

Claim 33, Hwang fails to disclose the transmit signal generator includes matrix decomposition functionality for decomposing a channel matrix into a unitary matrix and a triangular matrix, however, Ben-David discloses matrix decomposition functionality for decomposing a channel matrix into a unitary matrix and a triangular matrix ([0034]). Decomposing a matrix into triangular and unitary components makes the solving and manipulation of matrix equations much easier. Because of this advantage, it would have been obvious to one skilled in the art at the time of invention to incorporate the decomposition as disclosed by Ben-David into the invention of Hwang.

12. Claim 40 is rejected under 35 U.S.C. 103(a) as being unpatentable over Fitton (U.S. Pub. No. 2004/0028121) as applied to claim 35 above, and further in view of Ben-David (U.S. Pub. No. 2004/0101034).

Claim 40, Fitton fails to disclose the transmit signal generator includes matrix decomposition functionality for decomposing a channel matrix into a unitary matrix and a triangular matrix, however, Ben-David discloses matrix decomposition functionality for

Art Unit: 2611

decomposing a channel matrix into a unitary matrix and a triangular matrix ([0034]).

Decomposing a matrix into triangular and unitary components makes the solving and manipulation of matrix equations much easier. Because of this advantage, it would have been obvious to one skilled in the art at the time of invention to incorporate the decomposition as disclosed by Ben-David into the invention of Fitton.

Claim Rejections - 35 USC § 112

13. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

14. Claim 10 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

15. In Claim 10, the recitation "that would be output by a receiver of said specific user device as a result of transmitting said first data from said transmitter into said common channel without using interference mitigation" is unclear and is rendered indefinite.

Claim Objections

16. Claims 1-40 and 43 are objected to because of the following informalities:

Claims 1-14 provides for the use of "said first data, said second data, and said channel information, said transmit signal to be transmitted from said transmitter to said specific user device"

Art Unit: 2611

Claim 2 provides for the use of "said channel information for said dedicated channel",

Claims 4 and 5 provide for the use of "within a code division multiple access (CDMA) based system"

Claim 10 provides for the use of "without using interference mitigation"

Claim 15 provides for the use of "said common channel interference component and dedicated data to generate said transmit signal"

Claims 16 and 20 provide for the use of "known common channel transmit data and corresponding channel information"

Claim 19 provides for the use of "said common channel interference component and dedicated data to generate said transmit signal, wherein said transmit signal is transmitted using said at least one dipole antenna"

Claim 22 provides for the use of "said first data, said second data, and said channel information, said transmit signal to be transmitted from said transmitter to said specific user device"

Claim 23 provides for the use of "said channel information for said dedicated channel"

Claim 27 provides for the use of "said first data, said second data, and said channel information"

Claim 35 provides for the use of "said composite interference signal, dedicated data to be delivered to said user devices within said second class, and channel information associated with said user devices within said second class"

Claims 9, 17, 25, 30, 38, 43 provides for the use of "dirty paper cancellation techniques"

Art Unit: 2611

The term "use" does not clearly describe the subject matter and it is suggested that clarification of the methods/processes included in the claims.

Appropriate correction is required.

Allowable Subject Matter

17. Claim 12 is objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

18. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Erin M. File whose telephone number is (571)272-6040. The examiner can normally be reached on M-F 1:00PM-9:30PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David Payne can be reached on (571)272-3024. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Art Unit: 2611

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
